HOW WAS CAPE COD FORMED?

Continental ice debris (drift) created the landform you see at Heritage today when it advanced and retreated 21,000 years ago. In front of you are kettle holes and glacial moraines (ridges). This artist view of the formations will help you identify similar features as you walk through the grounds. Where might you find similar kettle holes on Cape Cod?

Hint: Most of the 365 freshwater pools on Cape Cod are kettle ponds formed by ice from glaciers.
